

# Dengue Rapid Test Range

Dengue is found in tropical and sub-tropical climates worldwide, mostly in urban and semi-urban areas. Classic Dengue infection is characterized by a sudden onset of fever, intense headache, myalgia, arthralgia and rash. Early detection and access to proper medical care lowers fatality rates below 1%.

Primary infection, which usually results in Dengue Fever (DF), causes IgM antibodies to increase to a detectable level in 3 to 5 days after the onset of fever.

Distinguishing Dengue IgG and IgM antibodies help in diagnosing primary and secondary infections. NS1 antigen is common to all dengue serotypes and can be used to detect either primary or secondary infections. It is more accurate in the first seven days.
